Remote Session — Step-by-Step Task Sheet

Saturday 31 October 2026 · 11:00 AM – 3:00 PM · from home

Git & GitHub Fundamentals · SYBCA AI · Sutex Bank College of Computer Applications & Science, Amroli

This session counts as **attendance**. Work for **at least 2 hours** between 11:00 AM and 3:00 PM. Everything you do is saved with its time, and your faculty see it live on the dashboard.

> 📝 **What you need**
>
> - A **laptop or PC** with internet (Part B needs a computer; Part A also works on a phone)
> - **Google Chrome**
> - Your **GitHub account** (the one you use on the course site)
> - The folder of your **AI project**

Step 0 — Get ready (10 minutes)

1. Open **https://sbccas.github.io/git-github-fundamentals/account/** in **Chrome**. On a phone: if it opens inside WhatsApp, tap ⋮ → **Open in Chrome**.
2. Tap **I agree — continue with GitHub** and sign in.
3. In **Edit profile**, check your **Roll no** — just your number, for example `541` — and tap **Save profile**.
4. Under **Your batch** it must say **BCA 2026 – SY AI**. If not, type the class code and tap **Join**.
5. Scroll down to **Remote session — Saturday 31 October**. This card is your checklist for today. ✅

Part A — On the course site (about 60 minutes)

1. **Missions M-12, M-13, M-14 and M-15** — open **Missions** from the menu. Read the story, type the commands in the terminal, and watch the goals tick. Stuck? Tap **Hint**.

2. **Unit 4 quiz** — open **Units** → **Unit 4**, scroll to the quiz at the end. Pass mark **60 %**; you may try again.
3. **Unit 5 quiz** — same, in **Unit 5**.
4. **Self-check** — open **More** → **Self-check** and take the final practice test.
5. Go back to your account page: all seven Part A items should show ✓.

> 💡 **Your active time**
>
> Your active time is counted whenever your progress changes on the course site — lessons, missions, quizzes. Keep the site open and keep working; finishing everything in 20 minutes and leaving does not count as 2 hours.

Part B — Upload your AI project to GitHub (about 60–75 minutes)

Your repository must have **all six**:

✓	Item
1	Repository is **public**
2	**README.md** — project name, what it does, how to run it, team members
3	**.gitignore** — so secret files are never uploaded
4	**At least 5 commits**
5	**One pull request merged** from a branch
6	A tag **v1.0**

> ⚠️ **Never upload API keys or passwords**
>
> AI projects often contain keys (OpenAI, Gemini, Groq …). Keep them in a file named `.env` and make sure `.env` is listed in `.gitignore` **before your first commit**. If a key was ever pushed to GitHub, **delete that key on the provider's website and create a new one** — deleting the file from GitHub is not enough, because history keeps it.

Choose **Way 1** (Git on your laptop — recommended) **or Way 2** (GitHub website only, if Git is not installed).

Way 1 — With Git on your laptop

B1. Check Git. Open **Git Bash** (or the VS Code terminal) and type:

```
Git Bash
$ git --version
git version 2.47.0.windows.1
```

No version shown? Install Git from https://git-scm.com and open Git Bash again. Then tell Git who you are (use the email of your GitHub account):

```
Git Bash
$ git config --global user.name "Your Name"
$ git config --global user.email "you@example.com"
```

B2. Create an empty repository on GitHub. On github.com tap **+** → **New repository**. Name it after your project (for example `ai-study-buddy`), choose **Public**, and **do not** tick *Add a README*. Tap **Create repository** and keep that page open — it shows your repository link.

B3. Open your project folder in the terminal. In File Explorer, open the project folder, right-click an empty area → **Open Git Bash here** (or open the folder in VS Code → **Terminal** → **New Terminal**).

B4. Create `.gitignore` FIRST. Create a new file named exactly `.gitignore` in the project folder and put these lines in it:

```
.env
venv/
.venv/
__pycache__/
node_modules/
*.log
```

B5. First commit.

Git Bash

```
$ git init
$ git status
$ git add .
$ git commit -m "Initial version of my AI project"
```

Look at the `git status` list before `git add .` — `.env` **must not appear**. If it does, fix `.gitignore` first.

B6. Push to GitHub. Copy the link from the GitHub page of step B2 and use it here:

Git Bash

```
$ git branch -M main
$ git remote add origin https://github.com/your-name/ai-study-buddy.git
$ git push -u origin main
```

A browser window may ask you to sign in to GitHub — allow it. Refresh the GitHub page: your files are there. 🎉

B7. Add a README. Create `README.md` in the folder with your project details:

```
# AI Study Buddy
An AI chatbot that answers questions from class notes.

## How to run
1. pip install -r requirements.txt
2. Put your API key in a .env file (see .env.example)
3. python app.py

## Team
- Your Name (541)
```

Git Bash

```
$ git add README.md
$ git commit -m "Add README"
$ git push
```

B8. More commits (5 in total). Make small, real improvements — each one is a commit: add `requirements.txt`, add `.env.example` (key names only, **no real keys**), add comments to your code, add a screenshot folder … After each change:

```
Git Bash

$ git add .
$ git commit -m "Describe what you changed"
$ git push
```

B9. A branch and a pull request.

```
Git Bash

$ git switch -c feature/readme-features
```

Add a **Features** section to `README.md`, then:

```
Git Bash

$ git add README.md
$ git commit -m "Add features section"
$ git push -u origin feature/readme-features
```

On GitHub tap **Compare & pull request** → **Create pull request** → **Merge pull request** → **Confirm merge**. Then bring the merge back to your laptop:

```
Git Bash

$ git switch main
$ git pull
```

B10. Tag v1.0.

```
Git Bash

$ git tag v1.0
$ git push origin v1.0
```

B11. Submit. Copy your repository link (for example `https://github.com/your-name/ai-study-buddy`), paste it on the account page under **Part B** and tap **Check and submit**. The site checks your repository and shows what is still missing — fix it and tap **Check again** until you see **6 of 6**.

Way 2 — GitHub website only (no Git installed)

W1. On github.com tap **+** → **New repository**, choose **Public**, **tick** ***Add a README file***, tap **Create**.

W2. `.gitignore` **first: Add file** → **Create new file**, name it `.gitignore`, paste the lines from step B4, tap **Commit changes**.

W3. Upload your project: Add file → **Upload files**, drag in your project files — **not** `.env`, `venv` or `node_modules` — and tap **Commit changes**. Upload in two or three parts, and edit the README (pencil 🖊) with your project details: each upload or edit is one commit — make **at least 5**.

W4. Branch and pull request: open `README.md` → pencil 🖊 → add a *Features* section → **Commit changes...** → choose **Create a new branch for this commit and start a pull request** → **Propose changes** → **Create pull request** → **Merge pull request** → **Confirm merge**.

W5. Tag v1.0: Releases → **Create a new release** → **Choose a tag** → type `v1.0` → **Create new tag** → **Publish release**.

W6. Submit as in step B11.

Part C — Class wall (optional, about 15 minutes)

1. Open **https://github.com/sbccas/sy-ai-2026-wall** and tap **Fork** → **Create fork**.
2. In **your fork**: **Add file** → **Create new file**. Name it with your roll number, for example `541.md`, and write:

```
# Your Full Name
- Roll no: 541
- GitHub: @your-username
- My AI project: https://github.com/your-name/ai-study-buddy
- One line about it: …
```

3. Tap **Commit changes**, then **Contribute** → **Open pull request**. Title: `541 - Your Name`. Tap **Create pull request**.

4. Copy the pull request link (it contains `/pull/`) and paste it on the account page under **Part C → Submit**.

Before 3:00 PM — final check

- Part A: seven ✓ on your account page
- Part B: **Checklist 6 of 6**
- Part C: pull request link submitted (bonus)
- You worked for **at least 2 hours**

If something goes wrong

Problem	What to do
Sign-in does not finish on the phone	Open the link in **Chrome**, not inside WhatsApp, and sign in again
"Repository not found or private"	On GitHub: **Settings** → **General** → **Change visibility** → **Public**, then **Check again**
"GitHub is busy right now"	Your link is saved. Wait 10–15 minutes and tap **Check again**
`git push` is rejected (*fetch first*)	Run `git pull --rebase origin main`, then `git push`
`src refspec main does not match any`	You have not committed yet — do step B5 first
`.env` warning on the account page	Delete the key on the provider's website, create a new one, remove `.env` from GitHub, add it to `.gitignore`
Anything else	Ask in the class WhatsApp group

All the best! 🌟
